The marine fuel optimization system allows the shipowners to track, measure and display the exact amount of fuel oil used. Fuel consumption optimization systems not only provide the amount of fuel used during the trip, but also provide additional data related to fuel usage. Vessel fuel optimization systems provide statistical information on various parameters, such as the amount of fuel used by a particular engine or generator while moving at sea or in port. To analyze fuel consumption, it ...

An optimum system onboard would include the ability to instantaneously monitor fuel burn rates from the wheelhouse. Individual engine and generator burn rates would be included, as well as fuel tank levels. This proactive monitoring would allow the crew to make decisions that positively impact fuel burn rates and efficiency.

Most modern engines use some type of fuel injection to deliver fuel to the cylinders. The ECU determines the amount of fuel to inject based on a number of sensor readings. Oxygen sensors tell the ECU whether the engine is running rich (too much fuel or too little oxygen) or running lean (too much oxygen or too little fuel) as compared to ideal conditions (known as stoichiometric).
