These include the temperature gradient, the properties of the material, and the path length that the heat follows. The thermal conductivity of the materials around us varies substantially, from those with low conductivities such as air with a value of  $0.024 \text{ W/m}\cdot\text{K}$  at  $0^\circ\text{C}$  to highly conductive metals like copper ( $385 \text{ W/m}\cdot\text{K}$ ).
