The chart given in Fig. 12 describes modelling and simulation method applied in this work. We have used the "Becker-Döring (BD)" models for the nucleation of pores in the matrix (homogeneous nucleation), at the grain boundaries, on the dislocations and other phases such as M 23 C 6 and Laves-phase (heterogeneous nucleation).

In this work we present the mathematical modeling and the simulation of the diffusive transport of an electron gas confined in a nanostructure. A coupled quantum-classical system is considered, where the coupling occurs in the momentum variable: the electrons are like point particles in the direction parallel to the gas, while they behave like waves in the transverse direction.

In this article we address the numerical study of 3D semiconductor devices for applications in electronics industry including charge generation phenomena due to impact ionization. With this aim, we propose two novel 3D finite element (FE) models (methods A and B), for electron and hole Drift-Diffusion (DD) current densities. Method A is based on a primal-mixed formulation of the DD model as a ...

Following are the disadvantages of using Modelling and Simulation --. Designing a model is an art which requires domain knowledge, training and experience. Operations are performed on the system using random number, hence difficult to predict the result. Simulation requires manpower and it is a time-consuming process.

In this paper we investigate a diffusive logistic model with a free boundary in one space dimension. We aim to use the dynamics of such a problem to describe the spreading of a new or invasive species, with the free boundary representing the expanding front.
