The Rheumatoid Hand Diagnostic Imaging - Kora

Magnetic resonance imaging (1.5 T) focused on the evaluation of the carpal and MCP joints. Both procedures were used to evaluate only the dominant hand and US additionally involved the evaluation of the dominant foot. Fluorescence optical imaging was used to evaluate both hands. The hands were placed on a preformed hand rest.

Rheumatoid arthritis (RA) imaging tests are used to look for signs of RA and to monitor the disease's progression. These tests primarily look for bone damage in the patient's joints caused by the inflammation associated with RA. X-rays used to be the most common form of imaging ordered, but they...

Magnetic resonance imaging (MRI) of hand, wrist, and foot joints is increasingly used in early arthritis and rheumatoid arthritis (RA), though mainly for research purposes. The advantage of MRI is its ability to sensitively depict both local inflammation and structural damage 1, 2.

Rheumatoid arthritis manifests as a symmetrical arthritis, most commonly affecting the hands. If the pattern of disease is not symmetrical, then a different diagnosis should be considered. In early rheumatoid there may be no changes visible on an X-ray. Ultrasound can be used to look for erosions, synovitis, and tenosynovitis.

Imaging of Musculoskeletal Disorders - Rheumatoid arthritis

Specialized Diagnostic Imaging Examination. Clinical signs of rheumatoid arthritis may present before they are evident on conventional (routine or special) radiographic views; MRI, CT, ultrasound and radionuclide bone scans are more sensitive for the detection of early signs of rheumatoid arthritis.

Because of overlapping phenotypical presentations, the diagnostic differentiation of rheumatoid arthritis (RA) and psoriatic arthritis (PsA) remains challenging. Thus, this study aimed to examine the diagnostic value of distinct imaging features obtained by high-resolution 3-T MRI for the diagnostic differentiation. Seventeen patients with PsA and 28 patients with RA were imaged at high ...
